

The IT Ecosystem

Technology as a Business Enabler

The downturn of the economy has had the effect of focusing corporate leaders on maximizing performance, reducing costs and driving productivity in their organizations. The IT department is not exempt from this scrutiny, and return on investment is increasingly highlighted for review, especially when it comes to capital-intensive purchase of computer equipment and communications infrastructure. Today's focus on information technology has shifted from the technology itself to the quantifiable benefits IT can demonstrate for a company's core business. Disciplined operational processes are the essential key to drive IT organisations toward this ideal of business relevance. Most IT organisations require sweeping changes to their operational processes to remain viable. The alternative is dismal, so the incentive is in place to either adapt or wither.

In the new economy, the solution complexity is on the rise, with business processes extending not only across different systems and components inside the same organisation, but also across different organizations internal and external. For this reason, integration of business processes, as well as software and system components, becomes more relevant when implementing new solutions. The solution must have the ability to provide insight across the different business sectors

Integrated Business Management

Netspeed's integrated solutions concentrate on definition and deployment of proactive processes which are driven by reducing operational costs through efficiency and customer satisfaction.

In line with the Netspeed Enterprise Solutions mission statement our service delivery model is based on ensuring long term relationships, based on consistently delivering a high quality output that creates value to our clients.

Our tested and proven solutions, which are unique comply with global standards, have been deployed successfully at various clients in the past.

Optimisation and Performance

What we do?

 Netspeed Enterprise Solutions is dedicated to creating a world where business applications, data and infrastructure are continuously monitored and available. Users need to stay continuously connected to mission critical applications, for example email and BlackBerry systems, regardless of outages caused by planned maintenance, natural disasters, component failures or configuration errors.

 The vision of zero business downtime has changed the way businesses think about high availability and disaster recovery. More importantly, it ensures added productivity, increased data protection and enhanced business relationships for our customers around the world.

 While application management is a critical component to providing continuous availability for mission-critical applications, it alone is not enough – the entire IT ecosystem surrounding the application must be considered. Netspeed Enterprise Solutions have solutions that protects the entire ecosystem by providing intelligent insight into all ecosystem components including the physical server hardware, network

The IT Ecosystème

Infrastructure, applications, data and operating system.

 Netspeed Enterprise Solutions provides a Enterprise Architecture Management Solution with full ecosystem protection, it provides IT administrators with confidence that the entire IT ecosystem remains healthy, and even when issues do occur, mission-critical applications are continuously available to end-users through our product suit..

How we do it?

A comprehensive delivery approach embodying, people, processes, and technology that enables SMMEs and large organisations to build competency and processes in key areas of business:
